

Vigie 255 M kit

VIGILANCE, safety around the pool

Alarm system for unfenced in-ground private or commercial pools that detects falls into the pool.

The VIGILANCE™ alarm system, utilizing passive sonar technology, employs up to four sensors strategically positioned below the water level and connected to a control panel. As this system analyses sound waves under the water, the effects of surface incidents like wind and rain, a common cause of false alarms, are significantly reduced.

In addition, and independently of the in-pool sensors, the same control panel can monitor an unlimited number of VIGIE MONTRE wristbands that trigger the alarm upon contact with water.

Compatible with all types of pools, including:

- **Mirror pools, overflow pool and pools with waterfall features,**
- **Pools fitted with automated covers.**

The VIGIE 255 M kit comprises 2 small inconspicuous sensors installed under the water line, a control panel, a wristband and a remote control. It is designed to meet the stipulations of the French pool safety standard NF P 90-307-1 (April 2009).

The sensors, the active parts of the detection system, are installed under the water line. This means that they are almost insensitive to surface events that are the most frequent cause of false alarms; ball falling into the pool, waves, rain, etc.

Another advantage of the VIGIE 255 M alarm system installation configuration - it is compatible with every type of pool, even those fitted with bar covers or automatic covers.

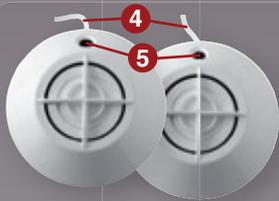

The mains powered control panel features a powerful integrated alarm. A backup battery assures continued operation of the control panel in the event of a power failure.

The system can be easily deactivated when the pool is in use. It resets automatically 10 minutes after the last bather leaves the pool. The system will automatically prolong standby mode in 2 minute increments for as long as people remain in the pool.

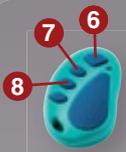

A minimum of two sensors must be installed, however for larger pools, free-form pools, or pools fitted with integrated cleaning systems, up to 4 sensors can be fitted.

The VIGIE 255 M kit comprises:

- 1 control panel with integrated alarm
- 2 piezoelectric sensors with digital signal processing (20 m cable)
- 1 VIGIE MONTRE wristband
- 1 230 V/12 V charger
- 1 backup battery (autonomy - more than 6 h)
- 1 RF remote control to enter commands from a distance and manage the winterizing function (comes with a battery)

Sound travels at 1,460 meters per second under water, a fall into the water is detected instantly by the sensor and transmitted via the cable 4 to the control panel. A red LED 5 lights up when a sensor detects an event.

Buttons 6 and 7 on the remote control are used to temporarily deactivate the system. Button 7 allows instant activation of the control unit. Winterizing function: press button 8 on the remote control simultaneously with buttons 2 and 3 on the control unit.

The control unit features an integrated 105 dBA alarm that is triggered when a fall into the pool is detected. To silence the alarm press either the red 2 or the green button 3 or press either 6 or 7 on the remote control.

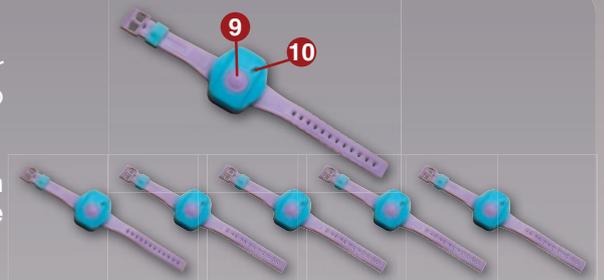

The red button 2 allows instant activation of the control unit. While buttons 2 and 3 are used to temporarily deactivate and/or test the system. The red and green LEDs indicate the system status (system activated or deactivated).

1 VIGIE MONTRE wristband included - Total safety 24/7

The control unit can monitor an unlimited number of VIGIE MONTRE wristbands. Irrespective of the system status, (active, standby, winterizing, etc), these wristbands will trigger the alarm as soon as the wristband

enters into contact with water (when a child or animal falls into the pool...).

Battery test: press the button 9 on the VIGIE MONTRE wristband: the red LED 10 should light up.

PRE-ALARM WIRELESS OPTIONS

CORVIGIE door open sensor and IREXVIGIE proximity sensor

Two wireless pre-alarm options can be added to the control unit. The CORVIGIE door open sensor and the IREXVIGIE proximity sensor. Upon activation, these sensors trigger a medium intensity alarm for 30 seconds. If no action is taken after 30 seconds, the alarm will sound at full power. Thus, you are instantly alerted of an unsafe situation and you can intervene before any contact with the water.

procopi.com

No pool protection system can replace the vigilance of a responsible adult.

An adult must watch the pool, remaining close by during the time taken for the system to automatically reset.

This alarm is a safety device that indicates danger (or the risk of danger). Rapid intervention, in less than 3 minutes, is mandatory if the alarm sounds.
